# MARKETS FOR FOREST PRODUCTS IN SOUTHEAST GEORGIA

by  
John J. Zirkle, Jr.  
and  
Arthur S. Todd, Jr.

Division of Forest Economics

SOUTHEASTERN FOREST EXPERIMENT STATION

ASHEVILLE, NORTH CAROLINA

I. T. HAIG, DIRECTOR

## Foreword

The purpose of this publication is to indicate the forest products for which markets exist, the relative prices paid, the general specifications under which they are purchased, and who buys them in each locality. The information presented was obtained from a county-by-county canvass of buyers conducted in March and April, 1949, under Title II, Section 203, of the Research and Marketing Act of 1946.

Work of this kind was approved as Project 5, which authorizes "research on the markets and prices for farm forest products." A companion report, "Markets for Forest Products in Southwest Georgia," was released as Station Paper No. 1 in May 1949. The authors take this opportunity to thank all the buyers, plant owners, and managers whose cooperation made these publications possible.

## MARKETS FOR FOREST PRODUCTS IN SOUTHEAST GEORGIA

### INTRODUCTION

The harvesting and primary manufacture of forest products occupies a prominent place among Georgia industries. In 1944, over 65,000 persons were so employed with almost 70 percent in the lumber, veneer, and pulpwood fields. The remainder were engaged in the production of a variety of products such as naval stores, poles, piling, and implement handles. In addition, since nearly half the forest area is on farms, many farmers devote part of their time to the production of woods products, particularly fence posts and hewn cross ties. The individual forested holdings that make all this activity possible are predominantly small; the farm woodlands, for example, average only 76 acres each.

Southeast Georgia is an important producing area. It is characterized by a greater proportion of large forest ownerships than other portions of the State. This is especially true of the coastal counties, which contain extensive unbroken areas of timber and comparatively little agriculture. Of the existing farms, a high proportion have woods (Table 1), and the average acreage of woodland per farm with woods is 140. The ownership pattern of the inland counties is more typical of the rest of Georgia, but here again the individual holdings are large; for example, there are 110 acres of woodland per farm.

Table 1.--Relative importance of farm woods in the coastal and inland counties of Southeast Georgia.

Area	: : Counties	: : Total	: Forest on	: : Farms	: Farms with
	: : Number	: : Acres	: : farms	: : Number	: : forest
Coastal	<u>1/</u> 13	3,835,600	17.1	6,804	68.6
Inland	<u>2/</u> 22	3,780,200	56.6	33,709	57.7

1/ Brantley, Bryan, Camden, Charlton, Chatham, Clinch, Echols, Glynn, Liberty, Long, McIntosh, Ware, and Wayne Counties.

2/ Appling, Atkinson, Bacon, Bulloch, Candler, Coffee, Dodge, Effingham, Emanuel, Evans, Jeff Davis, Jenkins, Johnson, Laurens, Montgomery, Pierce, Screven, Tattnall, Telfair, Toombs, Treutlen, and Wheeler Counties.

According to the Census of Agriculture, about 21 percent of the wooded farms sold forest products in 1944. This would seem to indicate that the average timber owner makes a sale from his woods every five years. However, this is not the whole story, for a high proportion of

the sales are of naval stores gum, the only important forest product that is ordinarily harvested annually. It is also the only rough forest product that is sold in a highly organized market. Products other than gum are seldom sold at intervals shorter than 12 or 15 years either by farmers or other small landowners. Thus, the average owner has only three or four opportunities during his life to sell the products which require the most in marketing skill and experience. As a result, he may not be able to appraise the suitability or value of his stand for the various products and probably is not aware of all the markets available to him.

The directories in this booklet showing markets are as complete as they could be made with the men and money available. Sawmills that buy only stumpage are omitted, because there are so many, and because most of them purchase timber by the boundary for a lump sum and operate in localized areas where they are well known. However, there are a few mills that purchase sawlogs in the open market, and these are included in the listings. Pulpwood producers are also purposely omitted since, for many, pulpwood production is not a principal occupation but secondary to some other livelihood such as logging, farming, or trucking. Moreover, many of the producers operate as contract cutters, haulers, and loaders of timber purchased on the responsibility of a paper company or pulpwood dealer. The men listed in the directories are the dealers.

Omissions other than those mentioned are unintentional and reflect in no way on the plants or individuals left out. By the same token, inclusion in the directory does not constitute a recommendation.

### PRICES

Certainly the most practical way to sell timber is to market the product which will net the largest return, without overcutting or otherwise impairing the opportunities for future sales. What that product may be will be determined by the quality, size, and species composition of the timber stand and by the markets which are available. Often it develops that sales of two or more products, such as poles and saw timber, or veneer logs and pulpwood, will yield a larger aggregate return than the sale of one average-quality product. Much of the farm woodland in Southeast Georgia lends itself to such combined sales, but to take advantage of this fact the owners must determine what products their individual stands are capable of producing, the location of markets for such products, and the price each prospective buyer will pay.

Table 2 on pages 4 and 5 lists the average prices that were paid for various species and products in February 1949. Since then, a slackening demand for many finished wood products and the presence of increasing amounts of timber on the market have caused a reduction in the prices being offered for stumpage and rough forest products. It should also be remembered that stand quality, topography, length of haul, and other physical factors all exert an influence on the price a buyer can afford to pay. For these reasons, the chief usefulness of the prices shown is for comparing products and species.

## PRODUCTS AND SPECIFICATIONS

There are no standardized and universally accepted specifications for timber or any of the rough forest products produced and sold in Southeast Georgia. The nearest approaches are the American Standards Association specifications for communication and power poles (see Appendix) and the American Railway Engineering Association specifications for cross ties, but even these are frequently modified to suit the needs or preferences of individual buyers.

The lack of uniformity is especially conspicuous in the various specifications for logs. Few if any lend themselves to precise definition, so much depends on the judgment of the individual scalers and graders. As a result, replacing the grader at a log-buying plant is almost certain to produce a change in the grading standards. To further complicate the situation, it is customary to relax or tighten the standards as market conditions change rather than to vary the volume of purchases by grades. Thus, with the present trend back to a buyers' market for lumber, veneer, and other log products, many plants still buy the same proportion of Number Two logs as a year ago. However, they are now down-grading some logs which would have been accepted as Number Ones at that time and are rejecting some logs which would have been classed as poor Number Twos.

Generalized specifications for most of the principal forest products are summarized in the following pages. In most cases, they are averages of those in use during April of this year and are presented to assist in judging for what products a tract of timber is suited. But, considering how specifications may vary both from plant to plant and from time to time at the same plant, it is unsafe to cut any forest product without a firm order and a thorough understanding of the customer's requirements.

### SAWLOGS

According to the most recent census, that of 1947, there were 433 sawmills in operation in Southeast Georgia. Their production totaled 298 million board feet of which 263 million board feet or 88 percent was softwoods, chiefly pine. Logs are obtained principally from leased timber which is cut by company or contract crews. At present, only 10 percent of the operators make a general practice of buying cut logs, and very few of them are dependent on their open-market purchases. Nevertheless, they bought 36 million board feet in 1948.

Specifications vary considerably from mill to mill and also from time to time at the same mill depending upon the grades and sizes of lumber in demand. When the market for low-grade boards and structural dimension was booming during and immediately following the War, most mills were glad to take woods-run logs of almost any description. During the past year, however, there has been a gradual tightening of log specifications, and log grading is more commonly practiced. At present, about one-half of the buyers employ some sort of grading system; the rest still buy woods-run.

TABLE 2.—AVERAGE PRICES PAID FOR STANDING TIMBER, LOGS,

Product	Basis of payment	Cypress	Yellow pine	Dead heart cypress and pine	Ash	Black and tupelo gums
		<u>Dollars</u>	<u>Dollars</u>	<u>Dollars</u>	<u>Dollars</u>	<u>Dollars</u>
Cross tie stumpage	Per tie	.48	.39			.29

Felt wood (for roofing felts)	Per standard cord (roadside)		11.00			11.00
Fence posts	Per piece (del'd.)		2/09	.27		
Furniture dimension logs	Per M bd. ft. Doyle (del'd.)				2/50.00	4/55.00
Handle and ski logs	Per M bd. ft. Doyle (del'd.)				2/55.00	
Hewn cross ties	Per piece (at R. R.)	(6/)	(7/)			(8/)
Piles	Per lineal foot (f.o.b. cars)		(9/)			
Polee	Per piece (f.o.b. cars)		(10/)			
Pulpwood	Per standard cord (f.o.b. cars)		10.75			10.32
Sawlogs—Grade 1	Per M bd. ft. Doyle (del'd.)	49.85	43.45		40.00	37.18
Sawlogs—Grade 2	Per M bd. ft. Doyle (del'd.)	28.11	30.38		25.00	26.39
Sawlogs—Woods—run	Per M bd. ft. Doyle (del'd.)	45.67	37.34		39.30	33.39
Shuttle bolts	Per standard cord (f.o.b. cars)					
Veneer logs (commercial)—Grade 1	Per M bd. ft. Doyle (del'd.)		50.00			52.42
Veneer logs (commercial)—Grade 2	Per M bd. ft. Doyle (del'd.)		35.00			38.18
Veneer logs (package)—Grade 1	Per M bd. ft. Doyle (del'd.)	40.00	43.19			43.55
Veneer logs (package)—Grade 2	Per M bd. ft. Doyle (del'd.)	23.00	23.29			23.89
Veneer logs (package)—Woods—run	Per M bd. ft. Doyle (del'd.)		37.50		35.45	38.31

1/ Ranges from \$0.30 to \$25.43 depending on class and length of pole.

2/ Applies to "running" posts 6½ feet long and up to 6 inches in diameter. Corner posts 8 feet long and 6 to 8 inches in diameter average \$0.29 each.

3/ Grade 1 logs only.

4/ Applies to Grade 1 only. Grade 2 logs average \$25.00 per thousand board feet.

5/ Woods—run logs.

BOLTS, ETC., BY PRODUCT AND SPECIES, FEBRUARY 15, 1949.

	35.00		38.82	39.69			38.43	38.90	40.00	38.26

6/ Ranges from \$0.90 for a Size 3 to \$1.50 for a Size 5.

7/ Ranges from \$0.75 for a Size 2 to \$1.45 for a Size 5.

8/ Demand uncertain and prices highly variable, averaging approximately same as for pine.

9/ Ranges from \$0.18 to \$0.30 depending on specifications.

10/ Ranges from \$1.00 to \$50.85 depending on class and length.

Woods-run logs must ordinarily be at least 10 inches in diameter inside bark at the small end, although some mills accept them as small as 6 inches. Lengths start at 10 or 12 feet plus a 4-inch allowance for trim and increase by 2-foot multiples. Maximums range from 16 feet to tree lengths. Holes not exceeding 3 inches in diameter are usually permitted, as is hollow heart up to 4 inches. Rules as to the acceptability of turpentine faces vary, from mills that accept none to those insisting only that faces be sound and free of metal such as tins, nails, and wire.

When sawlogs are purchased on grade, two grades are commonly recognized. The specifications are extremely variable, but a Grade One log must usually be 12 or more inches in diameter, straight, and with no more than two or three 3-inch knots or their equivalent in other rough defects. Checks, splits, shake, and holes are not admitted, but a small hollow heart may be. A Number Two is any log that does not qualify as a Number One but meets the woods-run specification given above.

Scaling is usually according to the Doyle Rule, but a number of sawmills in the Brunswick-Jesup-Waycross area use the Two-Thirds or Seven-Tenths Rule, while others buying tree lengths near the Florida line use the Preston. The Scribner Rule, which is rather frequently encountered in Southwest Georgia, is scarcely used at all, and only two operators were found who bought by International scale.

To avoid the necessity of scaling each of the logs in tree lengths, it is customary to assume standard rates of taper or "rise" and to take only one diameter measurement either at the end or center of the tree. A common procedure is to allow a rise of 1 inch in every 10 feet, which is sometimes increased to 2 inches for trees exceeding a certain length (usually 40 or 50 feet).

There are also various methods of adjusting log rules for the expected overrun. One operator employs what he calls "square measure," which is the Seven-Tenths scale plus 5 percent for logs less than 16 feet long or plus 10 percent for logs 16 feet and longer. Another applies the Doyle Rule to logs 15 inches and larger in diameter and adjusted Scribner values to smaller logs.

Most logs are purchased delivered to the mill, but some of the larger companies permit f.o.b. rail shipments from specified loading points. In such cases, the f.o.b. and delivered prices are often the same.

#### veneer timber and logs

With several large river bottoms (notably the Altamaha, the Ogeechee, and the Savannah) that still contain a substantial volume of old-growth hardwoods, Southeast Georgia supports a large veneer and plywood industry. Twenty-three plants, 13 local and 10 outside, draw all or part of their logs from the area. Among them are some of the largest in the eastern United States. In 1948, these mills consumed over 62 million board feet of

logs, 55 percent of which went into high-grade furniture and panel veneers. while the remainder produced veneer for wire-bound boxes, baskets, and hampers. The principal species were black and tupelo gums, followed in approximate order of importance by sweetgum, maple, yellow-poplar, sweet-bay, and magnolia. Most of the commercial veneer plants restrict their purchases to a few species, often just the gums. The package veneer plants, on the other hand, are able to utilize most of the so-called soft-textured hardwoods and occasionally even elm and sycamore.

Unlike sawmills, all the veneer plants buy cut logs and, in many cases, organize logging crews of their own only when open-market sources of supply prove inadequate. At present, company logging operations probably account for considerably less than one-half of the logs consumed, and the trend is toward further reducing this proportion. Chief reliance is placed on professional loggers who can provide a steady, year-round flow of logs, but many mills welcome logs from landowners who are also competent loggers, and a few even offer pick-up trucking services at cost.

Companies and loggers who buy standing veneer timber are in search of old-growth bottomland or swamp species primarily, but good-quality second growth is not barred. Since lowland logging is expensive, veneer men are even more concerned than other timber buyers with the volume of usable material per acre, and this is a prime factor in determining the merchantability of a tract and the price that can be paid for it. Dense, accessible stands of good-quality timber are at a premium, almost regardless of their distance from the nearest mill.

Veneer logs are bought on two grades at most of the plants, and the specifications for these grades are essentially the same for both commercial and package veneer. In general, a Grade One log must be at least 14 inches in diameter inside bark at the small end, reasonably straight, and clear of knots or other surface irregularities. Holes are not permitted, but hollow heart up to 3 inches in diameter is not considered a defect and is seldom deducted from the scale. A few mills employ over-sized lathe chucks and accept even larger hollows when a worthwhile collar of sound, clear wood surrounds them. The specifications for Grade Two are similar except they admit 12-inch logs and logs with as many as three knots not over 3 inches in diameter. A few buyers also recognize a Grade Three consisting of logs too poor for veneer, which are sawed into box cleats, basket bottoms, and occasionally into core stock. At mills which buy woods-run, the minimum specifications approximate those for Grade Two.

Acceptable lengths vary from plant to plant and are likely to change at the package plants whenever production is shifted from one item to another, as from small boxes to large crates. Most veneer mills buy short blocks cut to size ready for the lathe, as well as logs. These blocks are commonly 54, 56, or 58 inches long but may be either shorter or longer depending on the product. Short logs are usually cut in multiples of the block length, while longer logs may be bucked like saw-logs into 12-, 14-, 16-, 18-, and 20-foot lengths. A few package plants buy tree lengths.

Veneer logs are usually scaled according to the Doyle Rule, but the Doyle-Scribner is used at one or two mills. In scaling tree lengths by the Doyle Rule, only one diameter measurement is taken, and rules-of-thumb are depended upon to approximate the taper. One plant applies the scale without adjustment to all logs 19 feet and shorter and allows the scale plus  $12\frac{1}{2}$  percent for logs 20 to 24 feet inclusive. For still longer lengths, the additions are as follows: 15 percent for 25 to 28 feet, 20 percent for 29 to 33, 25 percent for 34 to 38, and 30 percent for 39 to 60.

Payment is customarily on a "delivered" basis, but several plants accept rail shipments in carload quantities.

### PULPWOOD

Five of the seven pulp mills in the State are located in Southeast Georgia. The other two, as well as six mills in adjoining states draw a portion of their wood supply from the area, which produced 757,000 standard cords of pulpwood in 1948. Almost 92 percent of this was pine. The main products are kraft paper, bags, and boards, but dissolving pulp, insulator board, and roofing felts are also manufactured.

Pulpwood timber is marketed in several ways, the most common of which is the sale of a boundary of timber for a lump sum. Also common is the practice of selling at a set rate per cord of wood removed. Under this set-up the timber owner is usually paid at the end of each week or month for the wood cut from his stand and shipped to the mill during that period. The authority on the amount of wood to be paid for is the mill's wood procurement division, which inspects and measures each barge, truck, or railroad car as it is received. Sales of land and timber are also frequent, since most pulp companies have well-developed land acquisition programs.

All the mills use a contract system to procure their wood. This consists of dividing the drawing territory into sub-areas, each of which is assigned to a contractor. In some cases, this individual is a salaried employee of the company, called an area manager, but more often he is an independent "dealer" working on a commission basis. It is his responsibility to supply the mill with a certain quota of wood each week. The dealer in turn lines up such producers as he needs and places each of them on a quota. Use of this system tends to assure a steady supply of wood and enables the mill to increase or decrease the rate of deliveries on comparatively short notice.

From the foregoing it may be seen that a landowner who desires to cut only his own timber must nearly always deal through a middleman rather than directly with the pulp company. Usually, he cuts and stacks the pulpwood in pens in the woods or in ricks along a road, where a producer or dealer purchases it. Or, if he has sufficient labor and equipment, he may operate as a sub-producer, cutting and hauling his wood as a part of some producer's quota.

Specifications for pulpwood are fairly uniform. Pine bolts must be not less than four inches in diameter inside bark at the small end, while the minimum diameter of hardwoods is five inches. Maximum diameters vary according to the size of the chippers at the mills, but bolts larger than 14 inches are seldom cut, as they are too heavy for loading crews to handle easily. The standard bolt length is 63 inches, although wood to be loaded in box cars or on flat cars is sometimes cut 60 inches. Bark is left on and should be tight, meaning that wood should ordinarily reach the mill within 30 days after it is cut. Knots and limbs must be trimmed flush and ends must be sawed square. Rotten, crooked, or forked sticks are not accepted. Most mills accept bolts with turpentine faces if the faces are sound, unburned, and free of metal. Two units of measure are employed. One, a stack of 63-inch wood 4 feet high, 8 feet long, and containing 168 cubic feet, is called a "unit." The other is the standard cord of 128 cubic feet. Which is used is immaterial, since prices based on the unit are proportionately larger than those based on the cord.

Trees 6 to 12 inches in diameter are preferred for pulpwood. However, pulpwood dealers and producers are usually ready to bid for saw timber and even poles where these classes of material occur in stands which also contain pulpwood sizes.

#### POLES AND PILING

Poles and piling are cut exclusively from pine. Only the best quality trees are suitable and, as these rarely occur in quantity through the average stand, boundary purchases of timber are seldom made for these products unless the buyer is also interested in other products such as saw timber or pulpwood. Pole stumpage is usually bought by the tree for 30 to 50 percent of the f.o.b. cars price for the peeled pole. Piling generally is paid for by the lineal foot. However, some buyers purchase only poles which they later sort for piling. Detailed specifications for southern pine poles have been developed by the American Standards Association (see Appendix), but piles must nearly always be cut to individual orders.

The markets for poles and piling are the large treating plants. These concerns have buyers located in the area who purchase both stumpage and the cut products. Few carry on logging operations themselves, preferring to contract such work. A very rough estimate of Southeast Georgia's 1948 production would be 225,000 poles of assorted lengths from 35 to 90 feet and 600,000 lineal feet of piling. There are six plants drawing regularly from the area, and two of these are located there.

#### HEWN CROSS TIES

Southeast Georgia is one of the leading centers of hewn tie production in the South. Many ties are produced by farmers and other part-time operators. At present, there is a relatively poor market for ties,

and production has been curtailed, but this condition is generally believed to be temporary. The tie buyers are the large treating plants, tie brokers, and the various railroads.

Tie timber buyers ordinarily pay for stumpage at so much per tie produced, regardless of size. Prices for hewn ties are based on delivery to a railroad siding, with a premium paid if the producer loads the ties on a car. A few of the treating plants and some of the brokers purchase stumpage and either operate their own crews or contract the work. The railroads, on the other hand, usually prefer to purchase cut ties directly from a producer or broker for treatment at a custom plant.

Cross ties are graded for size rather than quality. These size grades are as follows:

Class 1	6 x 6 inches
Class 2	6 x 7 inches
Class 3	6 x 8 inches (or 7 x 7 inches)
Class 4	7 x 8 inches
Class 5	7 x 9 inches

The demand at present is for Classes 3, 4, and 5, but some railroads accept limited quantities of smaller ties. Standard-gauge lengths are 8,  $8\frac{1}{2}$ , and 9 feet, but 8-foot ties are seldom produced except on special order. Between  $8\frac{1}{2}$ - and 9-foot ties there is a 10-cent price differential.

Ties must be hewed from living trees. All bark must be removed, the ends must be sawed square, and the top and bottom surfaces must be parallel and reasonably flat. Rot, hollow heart, holes, wind-shake, and through-splits or checks are prohibited defects. Knots are permitted, but they must be sound, tight, and trimmed flush with the surface. Cypress tie cuts may be halved or quartered to yield more than one tie, but the heart must be boxed in all other species.

#### NAVAL STORES GUM

Southeast Georgia is the heart of the gum naval stores industry and contains the principal gum-producing counties of the South. At one time, the crude gum was processed at hundreds of small fire stills. In 1934, for example, there were approximately 500 of these plants in the area. Since then, however, they have been largely replaced by large steam distillation plants. At present, there are probably less than 50 fire stills in operation, and only five of these buy gum. Instead, there are 15 centrally-located steam stills in the area and 4 more in neighboring counties to the west that buy gum produced here. In 1948, these plants purchased nearly 900,000 barrels, drawing from Florida and Southwest Georgia as well as from Southeast Georgia.

Crude gum is generally purchased directly from the producer, who delivers it to the plant. Upon delivery it is weighed, graded, and paid

for on the basis of its expected yield in gallons of turpentine and pounds of rosin. The prices applied are the daily turpentine and rosin quotations of the Savannah Naval Stores Market. Yields of turpentine and rosin per pound of gum are relatively constant, varying only slightly either geographically or with the passage of time, so whatever fluctuations occur in the price of gum largely reflect changes in the Savannah Market. And, since all the plants base their prices on this market, their prices for any one day are very similar.

## OTHER PRODUCTS

In addition to the products already described, there are a number of minor ones which deserve mention either because they are locally important or because they offer market outlets for species or classes of material that would not be salable otherwise.

Fence posts.--Seven treating plants located in Southeast Georgia and in adjacent counties to the west buy sap-pine fence posts in two standard sizes. The first size, known as a "running" post, is  $6\frac{1}{2}$  feet long. Diameter specifications vary, ranging from a minimum of  $2\frac{1}{4}$  inches to a maximum of 6, but most of the posts are 3 to 5 inches. The other size, used as a corner post, is 8 feet long and ranges in diameter from 5 to 8 inches. Purchases of standard posts at the seven plants probably reached 500,000 pieces in 1948, and special sizes purchased to fill orders for highway and other posts would undoubtedly bring the total to at least 650,000. Fence posts are customarily paid for by the piece even when purchased as stumpage.

A prominent industry developed in Clinch, Echols, and Ware Counties is the production of fence posts from "lightered" pine and dead heart cypress. The business is conducted on a rather informal basis, so no estimate of annual production exists. Local residents purchase the dead timber and cut the posts for sale locally or to buyers from other parts of the State. The sizes produced are roughly the same as for sap-pine posts, but most of these dead posts are split sections of large stems rather than round portions of small stems. Payment is by the piece for both stumpage and posts.

Box cleat bolts.--Cleats for wire-bound boxes are ordinarily resawn from lumber, but not always. Mention has already been made of the purchase of cull veneer logs for this purpose. There are also two package plants that buy bolt wood which they saw on specially-designed mills. The wood, purchased by the cord or unit, is cut in  $5\frac{1}{4}$ -foot lengths and is largely produced by loggers from the upper stems of veneer trees.

Small dimension logs and bolts.--One plant, in Liberty County, produces blanks for table legs and other furniture parts from blackgum and soft maple. The logs are purchased delivered in two lengths, 8 and 16 feet plus a trimming allowance of 4 inches per 8 feet, and are scaled according to the Doyle Rule. Two grades are recognized which are similar to those for veneer logs, except that logs as small as 10 inches are accepted.

A second furniture dimension plant, in Laurens County, buys ash bolts  $3\frac{1}{2}$  feet long and logs of the same species in 7- and 14-foot lengths (plus a 2-inch allowance for trim). Acceptable diameters are 8 to 30 inches inclusive, and the logs or bolts must have three clear faces with no knots on the fourth face exceeding 3 inches in diameter.

Another plant, located at Bainbridge, welcomes rail shipments from some points in Southeast Georgia. The items purchased are dogwood and persimmon bolts for shuttle blocks. These bolts are purchased by the standard cord in a variety of lengths ranging from 18 to 54 inches and must measure at least  $4\frac{1}{2}$  inches in diameter at the small end. All should be reasonably straight and show a clear spacing of 18 inches or more between defects or between defects and the ends of the bolt. A red heart or a hollow or doty center in a dogwood stick must be surrounded by at least  $2\frac{1}{2}$  inches of white wood.

Handle and ski logs.--Two handle plants are now obtaining logs from Southeast Georgia. One, located in Laurens County, buys oak in  $3\frac{1}{2}$ -, 7-, and 14-foot lengths (plus a 2-inch trimming allowance) for broom and mop handles. The specifications are the same as those given above for ash dimension.

The other plant, which is at Valdosta, purchases ash and hickory logs in 6-, 8-, 16-, and 24-foot lengths and to a minimum diameter of 8 inches. Only the hickory logs are graded. The Number One hickory is sawed into ski blanks, largely for export to Europe, while the Number Two and all the ash are manufactured into handles for striking tools. The ash and Number Two hickory must be 75 percent surface-clear and with not more than two knots per 6 feet of length. Slight crook and occasional mineral stains or bird pecks are permitted. The Number One hickory must be 100 percent clear and straight-grained. Both ash and hickory are limited to a maximum of 17 rings per inch. Hollow heart up to 25 percent of the diameter at the small end of the log does not affect the grade but is scaled out.

Naval stores stumps.--A plant in Brunswick buys the stumps of old-growth longleaf and slash pines, which are commonly referred to as "fat pine," "lightered pine," or "lightwood," and extracts turpentine, rosin, and various pine oils from them.

Stump-land is appraised for purchase in terms of "standard" 500-pound stumps. In actual practice, of course, three or four average-size stumps may be required to make this weight. It is difficult to generalize, but any easily accessible area at least 25 acres in extent and with a minimum of one standard stump per acre is potentially merchantable either now or at some future time. To be accessible, the ground must be firm enough to support heavy trucks and the standing timber, if any, sufficiently open for the operation of bulldozers. Small tracts are usually purchased for a lump sum, while the stumps on the larger tracts are paid for on the basis of the tonnage removed.

## INDEPENDENT LOGGERS

In addition to the purchasers of specific products, there is a large group of buyers that is not so easily classified. These companies and individuals are the independent loggers who purchase tracts of standing timber from which they log and sell a variety of cut products.

Many veneer plants depend entirely upon such men for their supply of raw material. Also, quite a few permanent sawmills supplement their own logging efforts with purchases of logs. Some loggers cut only one product, often contracting with a particular plant to furnish a certain volume of material each week or month, while others maintain contact with several markets, cutting and selling whatever products the stands they purchase will yield. This latter practice makes the independent loggers an excellent market for stands of mixed species and sizes.

The loggers whose names are listed in the directory are the ones whose principal occupation is the purchase and logging of standing timber. It does not contain the names of those who log under contract to timber owners. In many cases, the logger's name is listed only in his home county. Actually he may operate in several adjoining counties as well.

### MARKETING ASSISTANCE AVAILABLE

The District Foresters of the Georgia Department of Forestry are prepared to assist the landowners of Southeast Georgia in appraising, marking, and marketing their timber. Their territories are as follows:

W. H. McComb, Box 268, Statesboro

Bryan, Bulloch, Candler, Chatham, Effingham, Emanuel,  
Evans, Jenkins, Liberty, Long, McIntosh, Montgomery,  
Screven, Tattnall, Toombs, Treutlen, and Wheeler Counties.

Olin Witherington, Box 169, Americus

Dodge County.

Charles M. Everett, Court House, Macon

Johnson and Laurens Counties

M. E. Nixon, Waycross

Appling, Atkinson, Bacon, Brantley, Camden, Charlton,  
Clinch, Coffee, Echols, Glynn, Jeff Davis, Pierce,  
Telfair, Ware, and Wayne Counties.

In addition, Alrick H. Antonie, Box 268, Statesboro, of the Division of State and Private Forestry, U. S. Forest Service, is available for assistance to timber owners.

Landowners can also call upon consulting foresters. The consultants listed below have been approved by the Society of American Foresters and have indicated they are available for work in this area. There are undoubtedly other local private consultants who could also render assistance.

E. P. Ahern, Allen, Alabama

Carolina Forestry Co., Inc., Box 341, Clinton, N. C.

Keith Cranston, 4th and Huddleston, Leland, Miss.

William E. Dunham, Southern Foresters, Savannah, Ga.

Forest Managers, Inc., 1406 First St., Neptune Beach, Fla.

E. C. Haff, 836 Edisto Avenue, N. W., Orangeburg, S. C.

William H. Haley, Box 343, Hazlehurst, Ga.

Giles G. Hall, 1212 Laurens St., Aiken, S. C.

Robert K. Knoth and Co., 39 Broad St., Charleston 3, S. C.

Langdale Timber Co., Box 2, Valdosta, Ga.

T. A. Liefeld, Gilbert Hotel Bldg., Thomasville, Ga.

William J. Mills, 530 Volunteer Bldg., Chattanooga 2, Tenn.

John G. Rawls Co., 408 Rogers Avenue, Macon, Ga.

A. P. Russell, 11 Maplewood Drive, Sumter, S. C.

Harold M. Sebring, Box 23, McRae, Ga.

Alexander L. Setser, Box 23, Norris, Tenn.

S. I. Somberg and H. L. Lesselbaum, Lane, S. C.

J. Atwood Whitman, Glendon, N. C.

## APPENDIX

## SPECIFICATIONS FOR SOUTHERN PINE POLES

(Adapted from "American Standard Specifications and Dimensions for Wood Poles," American Standards Association, 05.1-1948).

These specifications cover southern pine poles which are to be given a preservative treatment. Poles are to be classified in accordance with the tables of dimensions.

The length and class of poles wanted shall be stated in the orders.

Complete detailed instructions shall be given the supplier in all cases where modifications are to be made in these specifications to meet special requirements.

### MATERIAL REQUIREMENTS

#### Species

All poles shall be cut from live southern pine timber, Longleaf Pine (*Pinus palustris*), Shortleaf Pine (*Pinus echinata*), Loblolly Pine (*Pinus taeda*), Slash Pine (*Pinus caribaea*), and Pond Pine (*Pinus rigida serotina*).

#### Prohibited Defects

Cross-breaks (cracks). Bird holes. Plugged holes, except increment borer holes. Hollow butts or tops, except as permitted under "Hollow pith centers" and "Defective butts." Marine borer damage. Splits or through-checks in the top. Decay, except as permitted under "Firm red heart," "Dead knots," and "Defective butts." Nails, spikes, and other metal not specifically authorized by the purchaser.

#### Permitted Defects

Sap stain.--Sap stain that is not accompanied by softening or other disintegration (decay) of the wood is permitted.

Firm red heart.--Firm red heart not accompanied by softening or other disintegration (decay) of the wood is permitted.

Spiral grain.--Spiral grain (twist grain) is permitted as follows:

<u>Length of pole</u>	<u>Maximum twist of grain permitted</u>
30 feet and shorter	1 complete twist in any 10 feet
35 to 45 feet	1 complete twist in any 16 feet
50 feet and longer	1 complete twist in any 20 feet

Hollow pith centers.--Hollow pith centers in the tops or butts and in knots are permitted in poles that are to be given full-length treatment.

### Limited Defects

Checks and splits in butts.--Through-checks or splits in the butt surface are permitted, provided that their height from the butt along the side surface does not exceed 2 feet.

Shakes.--Shakes in the butt surface extending through an arc of not more than 90 degrees are permitted. Shakes extending through an arc of more than 90 degrees are permitted when they are inside of a circle the center of which corresponds to the center of the butt surface and the diameter of which is not greater than one-half the average butt diameter.

Shakes in the top surface are permitted in poles that are to be given full-length treatment provided that the width of the shake does not exceed 1/16-inch and provided that the diameter of the shake is not greater than one-half the diameter of the top of the pole.

Insect damage.--Insect damage consisting of holes 1/16-inch or less in diameter, or surface scoring or channeling are permitted. All other forms of insect damage are prohibited.

Knots.--The diameter of any single knot or the sum of the diameters of all knots in any 1-foot section shall not exceed the limits set up in the following table. Knots  $\frac{1}{2}$ -inch or less in diameter shall be ignored in applying the limitations for the sum of diameters.

Maximum sizes of knots permitted

Length of pole	Diameter of any single knot		Sum of diameters of all knots in any 1-foot section
	Class 1 - 3	Class 4 - 10	All classes
	<u>Inches</u>	<u>Inches</u>	<u>Inches</u>
45 feet or less	4	3	8
50 feet or more	5	5	10

Dead knots.--Decay is permitted in knots provided it is not associated with heart rot.

Scars.--No pole shall have a scar or turpentine face located within 2 feet of the ground line. Turpentine scars need be trimmed only to the extent necessary to examine for evidence of fungus infection and insect damage. Other sound scars are permitted elsewhere on the pole surface, provided they are smoothly trimmed and do not interfere with the placing of cross arms or other fittings, and provided:

(a) That the circumference at any point on trimmed surfaces located between the butt and 2 feet below the ground line is not less than the minimum circumference specified at 6 feet from the butt for the class and length of the pole.

(b) That the depth of the trimmed scar is not more than 2 inches if the diameter of the pole is 10 inches or less, or one-fifth of the pole diameter at the location of the scar if such diameter is more than 10 inches.

Dead streaks.--Sound dead streaks not wider than one-fourth of the circumference of the pole at the point of measurement are permitted.

Compression wood.--The outer one inch of all poles shall be free from compression wood.

Defective butts.--Hollowing in the butt caused by "splinter pulling" in felling the tree is permitted, provided that the area of such a hollow is less than 10 percent of the butt area.

Shape.--Poles shall be free from short crooks. See diagrams on last page.

A pole may have sweep subject to the following limitations:

(a) Where sweep is in one plane and one direction only, a straight line joining the surface of the pole at the ground line and the edge of the pole at the top shall not be distant from the surface of the pole at any point by an amount greater than 1 inch for each 6 feet of length between these points.

(b) Where sweep is in two planes (double sweep) or in two directions in one plane (reverse sweep), a straight line connecting the mid-point at the ground line with the mid-point at the top shall not at any intermediate point pass through the external surface of the pole.

## DIMENSIONS

### Length

Poles less than 50 feet in length shall not be more than 3 inches shorter or 6 inches longer than nominal length. Poles 50 feet or over in length shall not be more than 6 inches shorter or 12 inches longer than nominal length.

Length shall be measured between the extreme ends of the pole.

### Circumference

The minimum circumferences and corresponding diameters at 6 feet from the butt (except for Classes 8, 9, and 10) and at the top for each length and class of pole are listed in the tables of dimensions. The

circumference at 6 feet from the butt of poles in Classes 1 to 7 inclusive, shall be not more than 7 inches larger than the specified minimum.

The top dimensional requirement shall apply at a point corresponding to the minimum length permitted for the pole.

### Classification

The true circumference class shall be determined as follows: Measure the circumference at 6 feet from the butt. This dimension will determine the true class of the pole, provided that its top (measured at the minimum length point) is large enough. Otherwise, the circumference at the top will determine the true class, provided that the circumference at 6 feet from the butt does not exceed the specified minimum by more than 7 inches.

## MANUFACTURING REQUIREMENTS

### Bark Removal

Outer bark shall be completely removed from all poles.

On all poles no patch of inner bark more than 1 inch wide shall be left on the pole surface between the butt and 2 feet below the ground line.

On poles that are to be full-length treated, no patch of inner bark larger than 1 inch wide and 6 inches long shall be left on the pole surface between the top and 2 feet below the ground line.

On poles that are to be butt-treated, no patch of inner bark larger than 1 inch wide and 6 inches long shall be left on the pole surface between points 1 foot above and 2 feet below the ground line.

### Sawing

All poles shall be neatly sawed at the top (unless otherwise ordered) and at the butt along a plane which shall not be out of square with the axis of the pole by more than 2 inches per foot of diameter of the sawed surface. Beveling at the edge of the sawed butt surface not more than one-twelfth of the butt diameter in width, or an equivalent area unsymmetrically located, is permitted.

### Trimming

Completely overgrown knots rising more than 1 inch above the pole surface, branch stubs, and partially overgrown knots, shall be trimmed close. Completely overgrown knots less than 1 inch high need not be trimmed. Trimming may be done by shaving machine or by hand.

## STORAGE AND HANDLING

### Storage

When it is necessary for any reason to hold poles in storage, they shall be stacked on treated skids of such dimensions and so arranged as to support the poles without producing noticeable distortion of any of them. Poles shall be piled in such a manner as to permit free circulation of air, and they shall be supported at all points at least 1 foot above the general ground level or any vegetation growing thereon. No decayed or decaying wood shall be permitted to remain underneath stored poles.

### Handling

Pole tongs, cant hooks, or other tools shall not be applied to the ground line section of any pole.

## DEFINITION OF TERMS

The following definitions shall apply in these specifications:

Check.--A check is a separation of the wood along the grain, the greater part of which occurs across the rings of annual growth. A through-check extends from surface to surface of the pole, usually through the pith center.

Compression wood.--Compression wood is abnormal wood that often forms on the lower side of branches and inclined trunks of coniferous trees. Compression wood is (a) characterized by relatively wide annual rings, usually eccentric; (b) has a relatively high proportion of summerwood (frequently more than 50 percent of the width of the annual rings in which it occurs); (c) exhibits but little contrast in color between springwood and summerwood, and (d) shrinks excessively lengthwise as compared with normal wood.

Cross-break (crack).--A cross-break is a separation of the wood cells across the grain. Such breaks may be due to internal strains resulting from unequal longitudinal shrinkage or to external forces.

Dead knot.--A dead knot is a knot left by a branch that died before the tree was cut. An encased knot is a dead knot in which the growth layers are not intergrown with those of the surrounding wood. Dead knots may contain soft fibers (decay) that usually do not extend deeper than an inch or two from the pole surface. They are distinct from rotten or decayed knots in which the loose or soft fibers (decay) may extend the full length of the knot into the pole, and which are frequently associated with heart rot.

Dead streak.--A dead streak is any portion of the sapwood in which the life processes had ended prior to the cutting of the tree. A dead streak starts from the butt and differs from a wound, such as a cat face

or scar, where the growth of new wood shows that life processes are still acting to repair the injured part.

Decay.--Decay is the disintegration of wood substance due to the action of wood-destroying fungi. Rot and dote mean the same as decay.

Face of pole.--The face of a pole is the concave side, or the side of greatest curvature in poles having reverse or double sweep, between the ground line and top.

Ground-line section.--The ground-line section is that portion of a pole between 1 foot above and 2 feet below the ground line as defined in the pole dimension tables.

Hollow heart.--A hollow heart is a hollow in the heartwood of a living tree caused by insects or fungi.

Hollow pith center.--A hollow pith center is a small hole at the center of the trunk, or of a knot, caused by disintegration of the pith (small soft core occurring in the structural center of a tree or branch).

Insect damage.--Insect damage is the result of boring in the pole by insects or insect larvae. Scoring or channeling of the pole surface is not classed as insect damage.

Knot diameter.--A knot diameter is the diameter of a knot on the surface of the pole measured in a direction at right angles to the lengthwise axis of the pole.

Red heart.--Red heart is caused by a fungus, *Fomes pini*, that occurs in the living tree. It is characterized in the early stages of infection by a reddish or brownish color in the heartwood. This is known as "firm red heart." Later the wood, in the case of the living tree, disintegrates (decays) in small, usually distinct areas that develop into white-line pockets.

Sap stain.--Sap stain is a discoloration of the sapwood caused by the action of certain molds and fungi that is not accompanied by softening or disintegration of the wood.

Scar (cat face).--A scar is a depression in the surface of the pole resulting from a wound where healing has not re-established the normal cross-section of the pole.

Shake.--A shake is a separation along the grain, the greater part of which occurs between the rings of annual growth.

Short crook.--A short crook is a localized deviation from straightness which, within any section 5 feet or less in length, is more than one-half the mean diameter of the crooked section. See diagrams on last page.

Spiral grain (twist grain).--Spiral grain is a type of growth in which the fibers take a spiral course about the bole of a tree instead of the normal vertical course. The spiral may extend right-handed or left-handed around the tree trunk. The amount of spiral grain in a pole is measured as the distance in feet along the axis of the pole in which one complete twist of the spiral occurs, and is expressed as for example, 1 in 10.

Split.--A split is a lengthwise separation of the wood due to the tearing apart of the wood cells, extending from surface to surface of the pole.

Sweep.--Sweep is the deviation of a pole from straightness. See diagrams on last page.

Dimensions of southern pine poles  
(Fiber stress 7,400 pounds per square inch)

Class	1	2	3	4	5	6	7	8	9	10
Minimum circumference at top (Inches)	27	25	23	21	19	17	15	18	15	12
Length of pole	Distance of butt to ground line <sup>1/</sup>	Minimum circumference at 6 feet from butt

# MEASUREMENT OF SWEEP AND SHORT CROOK IN POLES

\* NATIONAL AGRICULTURAL LIBRARY

1022589950

## SWEEP IN ONE PLANE AND ONE DIRECTION

## SWEEP IN TWO PLANES (DOUBLE SWEEP) OR IN TWO DIRECTIONS IN ONE PLANE (REVERSE SWEEP)

## SHORT CROOK WITH REFERENCE AXES APPROXIMATELY PARALLEL

## SHORT CROOK WITH REFERENCE AXES COINCIDENT OR PRACTICALLY SO

## SHORT CROOK WITH REFERENCE AXES NEITHER COINCIDENT NOR PARALLEL

Note: The three cases shown under SHORT CROOK are typical and are intended to establish the principle of measuring short crooks. There may be other cases not exactly like those illustrated.
